Javascript: Novice to Ninja – Chapter 8: Forms

There is an example html that goes along with this reading: week4/search.html

```
<!doctype html>
<html lang='en'>
<head>
    <meta charset='utf-8'>
    <title>Search</title>
</head>
<body>
    <form name='search' action='/search'>
        <input name='searchInput'>
        <button type='submit'>Search</button>
    </form>
<script src='main.js'></script>
</body>
</html>
```

Accessing Form Elements

Use the DOM to access the form by the name attribute of the form. Use dot notation. All the forms are "document.forms" and the one we just made, with name='search' is:

```
const form = document.forms.search
```

'elements' method returns all elements contained in the form. Our form has two elements, an input and a button:

```
const [input,button] = form.elements;
```
